

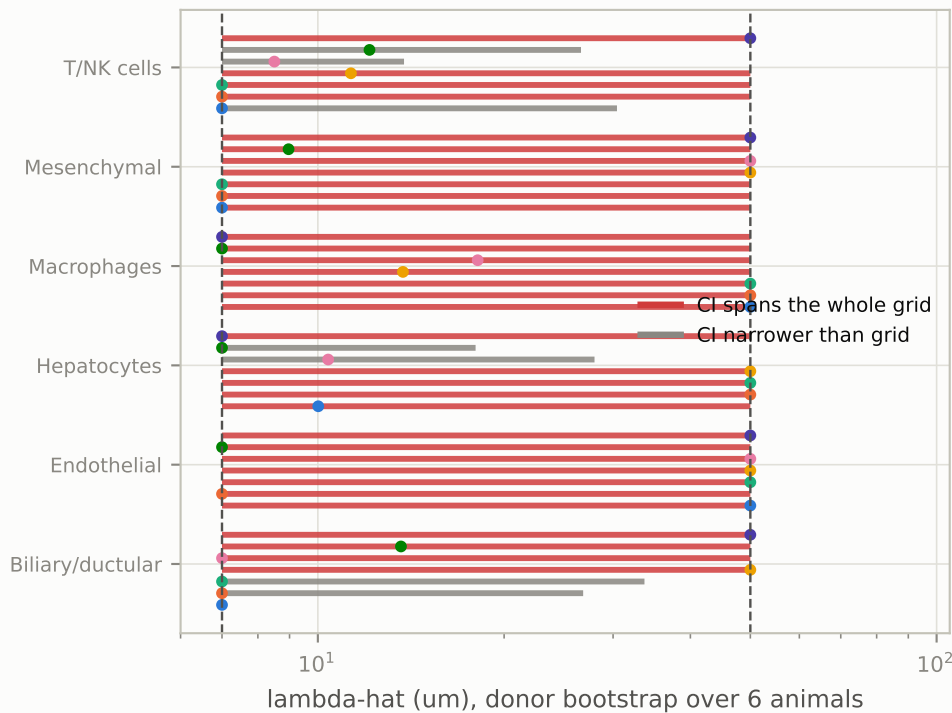

Figure 3 Controlled kernel estimates — nothing is identified, and each panel says so with a bound

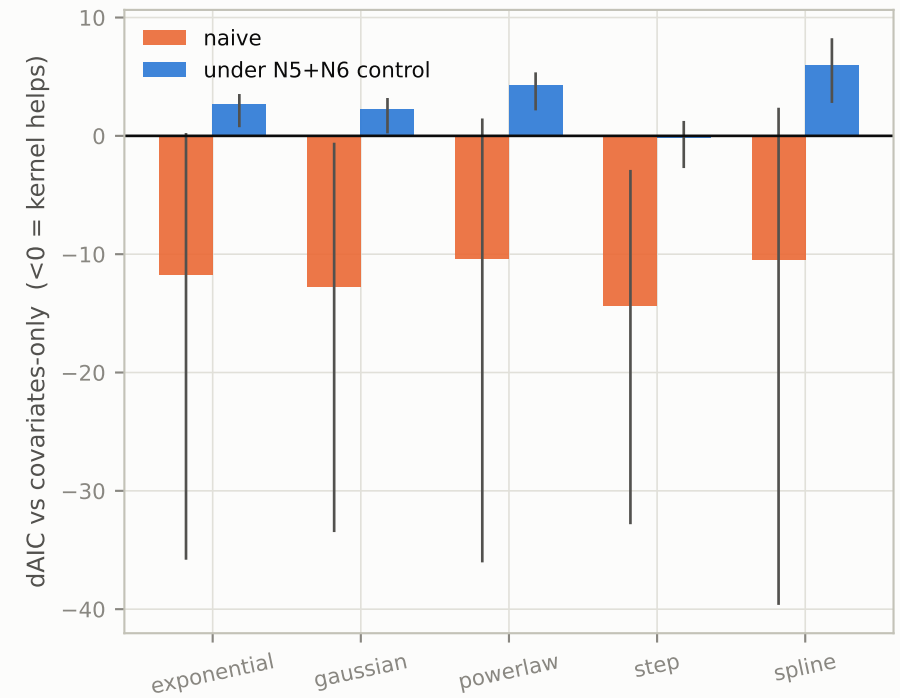

(a) No length constant is identified

34 of 42 donor-bootstrap CIs on lambda under N5+N6 span all of [7, 50] um

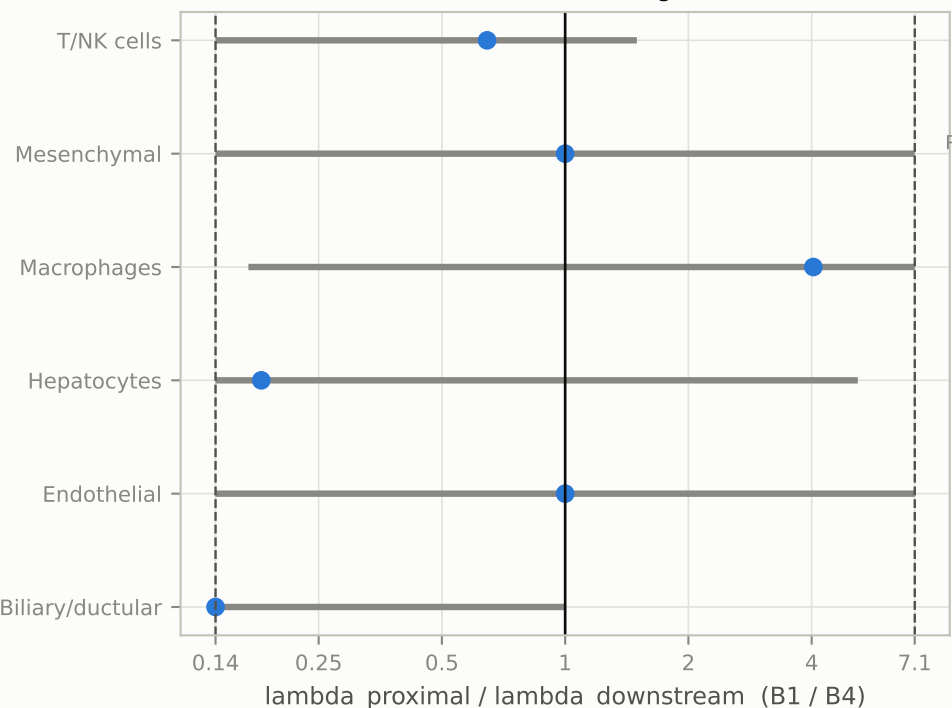

(b) Under control no family earns its place

step wins 90% of fits by AIC and still only beats no kernel in 51%

(c) Section 6.4 is not estimable here

dashed = the widest ratio the [7, 50] um grid allows; 2/6 CIs reach it

(d) Section 6.3 is answerable in synthetic tissue and not on this data:

the real spread is ~3 orders of magnitude smaller, at every sender caller
