

Tier A / Tier B disjointness — Phase 7 §11 gate, both arms (frozen 2026-08-27)

(b) is the §11 gate. Green-outlined cells are what the gate asserts: the PRIMARY sender set must be disjoint from all seven modules, each per-module sensitivity set from its own module only. Every outlined cell is 0 on both arms (asserted in code, not eyeballed). Unoutlined non-zeros are expected and are not gate failures. (a) shows the collisions that had to be removed, and the §10 Tier A that failed. (c) is where C6's cost sits: B7nB1 rose 10→26 and B7nB5 6→20 in human — the n_preC6 column of the data file carries the pre-C6 values.
