

Cross-arm gene-set symmetry, pre- and post-C6 — Phase 7 §17

EQUAL SIZE IS NOT IDENTITY. The two frozen Tier A sets are both n=33 but share only 27 members (26 through the pinned 1:1 MGI map, plus CDKN2B, which both arms carry and the map has no row for). Mouse-only, complete: HMGA1 LMNB2 PLK3 RIF1 SESN1 H2afx (6 = 33 - 27; H2afx is real — human H2AFX is in B4 and is removed from human Tier A by disjointness). Human-only: DDB2 GADD45G MDC1 PHLDA3 TNFRSF10B XPC. Frozen B7 is 108 vs 116 with 88 shared (85 by the pinned map + CCL3 CXCL2 CXCL3) — the residual gap is driven by REACTOME_SASP having 40 mouse members and 111 human ones. The dark segments plot the map-gap-corrected shared counts; panel (c) is a DIFFERENT quantity (set n ortholog-intersected panel) that happens to coincide at 88 for human B7.
