

SenePy coverage of spleen — caller 2 is not the same estimator across arms

(a) the 22 spleen cell types vs the best SenePy hub available

(b) hub collapse — distinct hubs are far fewer than labels

SenePy 1.0.1 ships 65 human hubs across 10 tissues: blood, bone marrow, heart, hippocampus, intestine, kidney, liver, lung, skin, tongue. SPLEEN IS ABSENT; LIVER IS PRESENT, so M1 used tissue-matched hubs and H1 cannot. Tissue-matched: 0. Cross-tissue surrogate: 15. No hub at all: 7 (cDC1, cDC2, pDC, lymphatic endothelium, erythroid, megakaryocyte, mesothelial) — those cells get no SenePy score, so audit test A3's sender counts are over a subset for this caller and over all cells for the others.
