

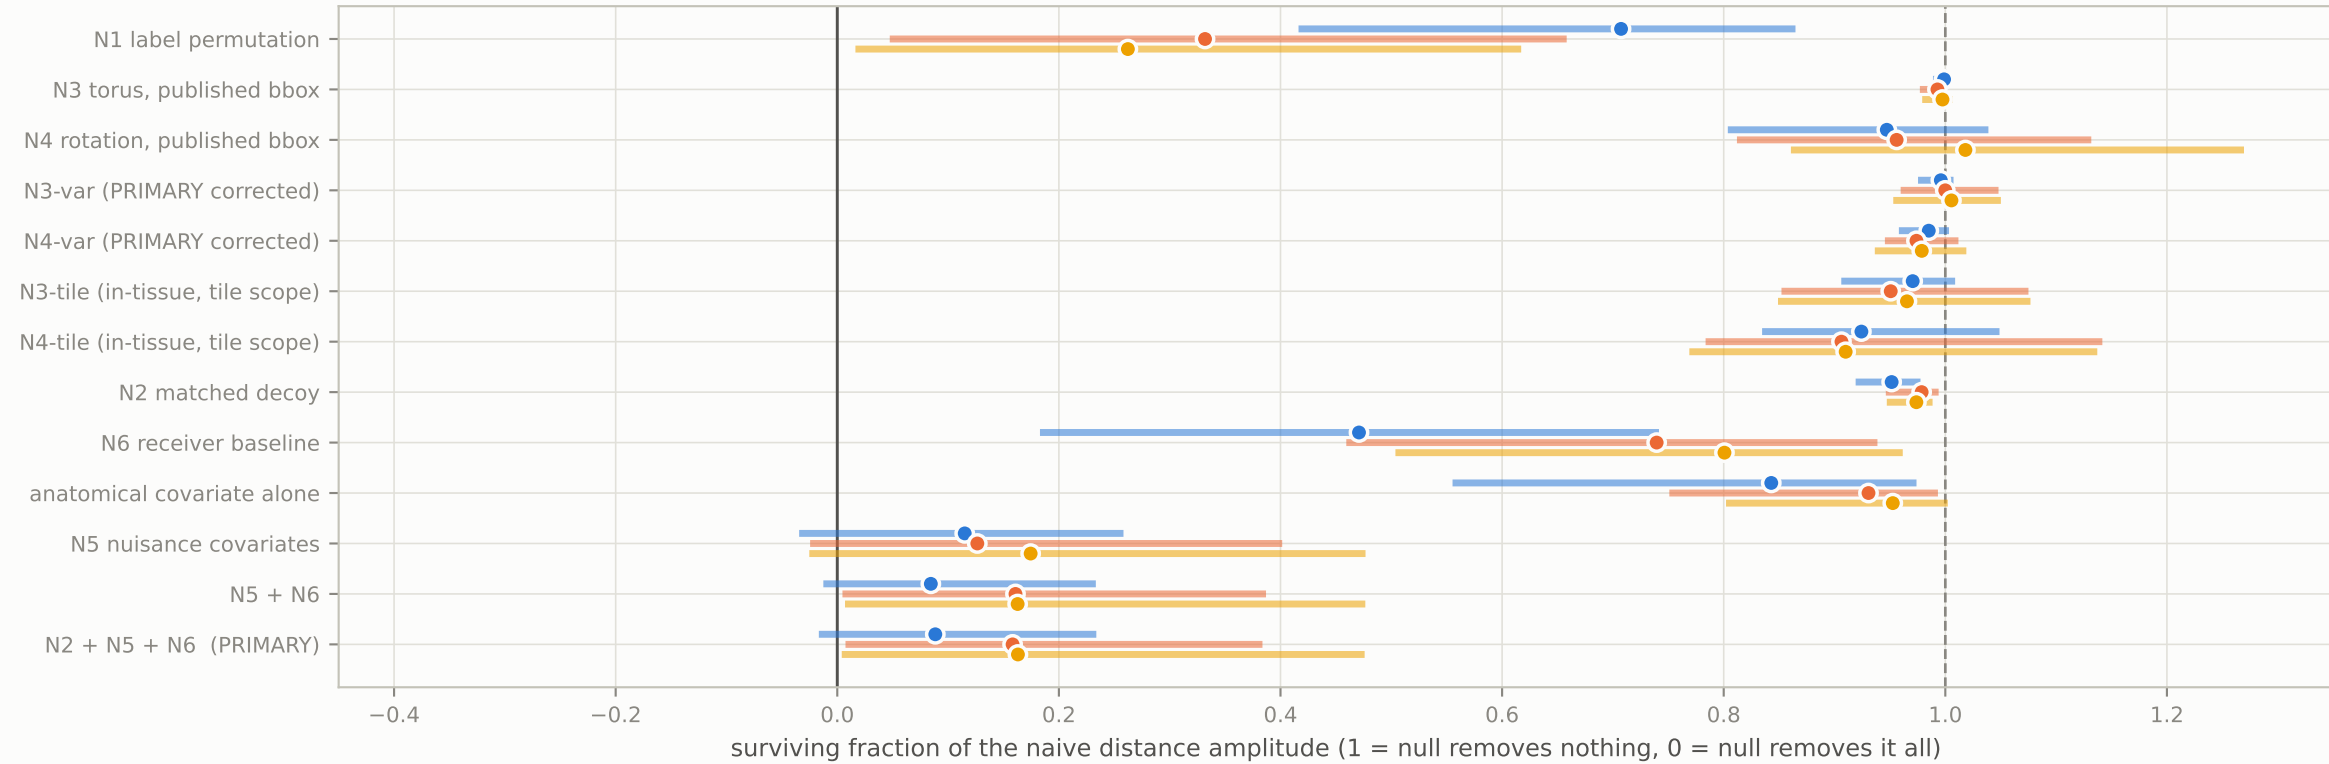

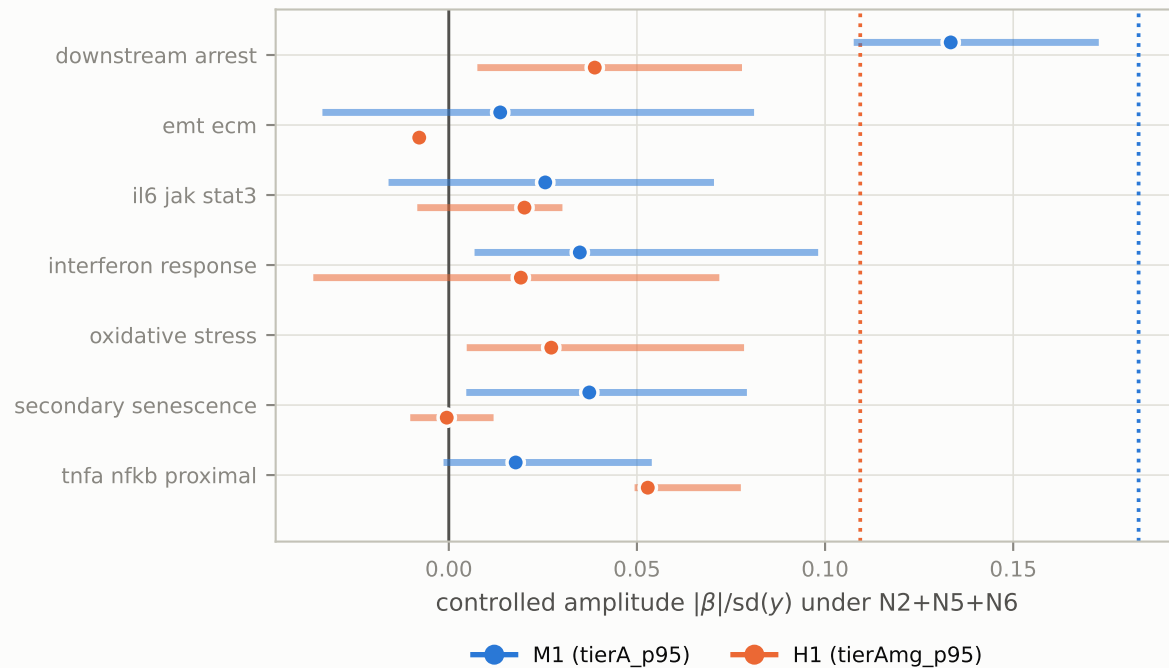

Figure 5 — Two-arm replication: M1 mouse liver (GSE310392, 6 admissible sections) against H1 human spleen (GSE326743, 7 sections)
Species and tissue are confounded by design and no difference below may be attributed to either (PREREG §10.5).

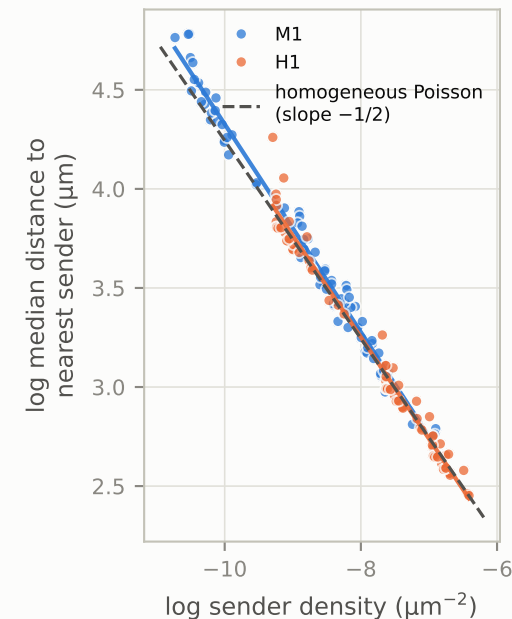

(a) Surviving fraction by null, both arms. Point = median over that arm's reportable fits; bar = inter-quartile range across fits (NOT a confidence interval)

(b) §17 as a forest plot: each Tier B module against its own arm's 80 %-power detectable bound (dotted). Nothing crosses it on either arm.

(c1) R3a Poisson identity

(c2) R3b $\hat{\lambda}$ railing
