

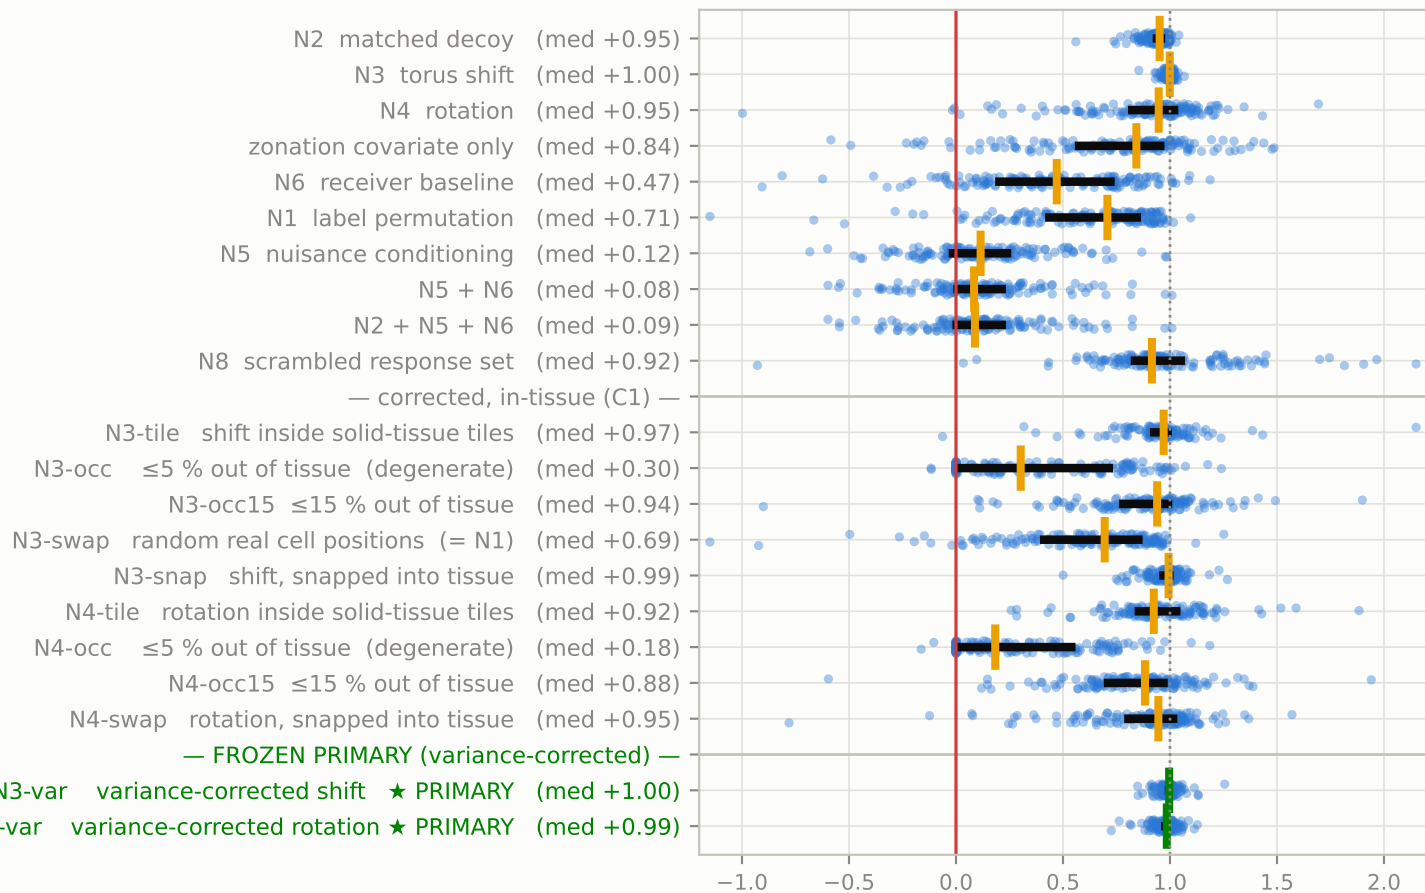

Figure 2c — surviving fraction under each null, with the corrected in-tissue N3/N4
and the frozen primary variance-corrected null

six Test-3-admissible sections, tierA_p95, receiver type x Tier B module; n = 153 of 315 fits with a positive, bootstrap-nonzero naive amplitude

surviving fraction of $\hat{\beta}$ (1 = the null removes nothing, 0 = it removes all of it)
